## Summary

AI Engineer currently pursuing an MSc in Data Science, building LLM-powered systems end-to-end, from the model to the infrastructure around it. Spent six months finding and fixing cost and performance problems in a production AI system before they reached users. Building independent projects in retrieval, multi-agent systems, and applied AI alongside my studies.

## Experience

### AI Engineer - Working Student, Firmway GmbH

03/2026 – 09/2026 | Frankfurt, Germany

- Built an AI cost-tracking dashboard breaking down spend by model and provider, and caught a pricing bug before deployment that would have undercounted costs by a third when a new model launched.
- Built the Quotation Planner, a config-driven system that predicts project cost and yield from company data before a single request runs.
- Connected Exa and Bright Data as interchangeable search providers, turning vendor changes from a code rewrite into a one-line configuration update.
- Set up OpenTelemetry tracing across 8 microservices, uncovering an API call responsible for 88% of request time, and migrated hardcoded prompts to Langfuse for configurable AI behaviour.
- Integrated PostHog into the customer app to track real usage patterns, replacing guesswork with actual behavioural data.

## Education

### MSc Data Science, Arden Berlin

05/2026 – Present | Berlin

### MSc Computer Science, IU Berlin

09/2023 – 04/2026 | Berlin

### Bachelor of Computer Applications (BCA), Gujarat University

07/2019 – 04/2022

## Skills

### AI & LLM

LLM Integration, RAG, Prompt Engineering, AI Agents

### Backend

Python, Java, FastAPI, Django, Node.js, REST APIs, Docker

### Observability

OpenTelemetry, Langfuse, Distributed Tracing

### Databases

PostgreSQL, Supabase, MySQL

### Frontend

React, Next.js, TypeScript, Tailwind CSS

### Tools

Git, GitHub, GitLab

## Projects

### Madhav, (Python · FastAPI · Hybrid Retrieval)

08/2026

Developed a citation-grounded RAG system that answers personal questions using verses from the Bhagavad Gita. Combines keyword and semantic retrieval, then verifies every citation against the source text before generating a response.

### Pulse, (Python · Multi-Agent Orchestration)

06/2026

Designed and implemented a multi-agent LinkedIn content pipeline with five specialised AI agents: research, ranking, drafting, editing, and tone refinement, including human approval before publishing and using post-performance data to improve future topic selection.

### Startup Intelligence Agent, (Next.js · PostgreSQL · Structured LLM Output)

05/2026

Created an AI agent that evaluates startup ideas across market size, competition, and execution feasibility before producing a structured verdict. For promising ideas, it generates a functional landing page in the same session.

### MovieWise XAI Master's Thesis, (Python · LightFM · Ollama · TF-IDF)

12/2025

Developed a hybrid movie recommendation system that explains its recommendations in plain language using a locally hosted LLM. Grounded explanations in the same data used for ranking; independently developed as a master's thesis and graded 1.3 (94/100).
